EX NO :1B

## Linux Networking Commands

Every computer is connected to some other computer through a network whether internally or externally to exchange some information. This network can be small as some computers connected in your home or office, or can be large or complicated as in large University or the entire Internet.

Maintaining a system's network is a task of System/Network administrator. Their task includes network configuration and troubleshooting.

Here is a list of Networking and Troubleshooting commands:

<a href="#"><u>ifconfig</u></a>	Display and manipulate route and network interfaces.
<a href="#"><u>ip</u></a>	It is a replacement of ifconfig command.
<a href="#"><u>traceroute</u></a>	Network troubleshooting utility.
<a href="#"><u>tracpath</u></a>	Similar to traceroute but doesn't require root privileges.
<a href="#"><u>ping</u></a>	To check connectivity between two nodes.
<a href="#"><u>netstat</u></a>	Display connection information.
<a href="#"><u>ss</u></a>	It is a replacement of netstat.
<a href="#"><u>dig</u></a>	Query DNS related information.
<a href="#"><u>nslookup</u></a>	Find DNS related query.
<a href="#"><u>route</u></a>	Shows and manipulate IP routing table.
<a href="#"><u>host</u></a>	Performs DNS lookups.
<a href="#"><u>arp</u></a>	View or add contents of the kernel's ARP table.
<a href="#"><u>iwconfig</u></a>	Used to configure wireless network interface.

<a href="#"><u>hostname</u></a>	To identify a network name.
<a href="#"><u>curl or wget</u></a>	To download a file from internet.
<a href="#"><u>mtr</u></a>	Combines ping and tracepath into a single command.
<a href="#"><u>whois</u></a>	Will tell you about the website's whois.
<a href="#"><u>ifplugstatus</u></a>	Tells whether a cable is plugged in or not.

Explanation of the above commands:

**1.ifconfig:** ifconfig is short for interface configurator. This command is utilized in network inspection, initializing the interface, enabling or disabling an IP address, and configuring an interface with an IP address. Also, it is used to show the network and route interface.

The basic details shown with ifconfig are:

- MTU
- MAC address
- IP address

**Syntax:**

Ifconfig

```

root@ip-10-10-38-111:~# ifconfig
docker0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 172.17.0.1 netmask 255.255.0.0 broadcast 172.17.255.255
    inet6 fe80::42:16ff:fec8:24d5 prefixlen 64 scopeid 0x20<link>
    ether 02:42:16:c8:24:d5 txqueuelen 0 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 35 bytes 4761 (4.7 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

ens5: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 9001
    inet 10.10.38.111 netmask 255.255.0.0 broadcast 10.10.255.255
    inet6 fe80::4a:89ff:fe31:79dd prefixlen 64 scopeid 0x20<link>
    ether 02:4a:89:31:79:dd txqueuelen 1000 (Ethernet)
    RX packets 8907 bytes 715564 (715.5 KB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 6758 bytes 4150018 (4.1 MB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 1000 (Local Loopback)
    RX packets 15766 bytes 4606708 (4.6 MB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 15766 bytes 4606708 (4.6 MB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

veth9ddb7c8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet6 fe80::540c:a4ff:fe12:a53b prefixlen 64 scopeid 0x20<link>
    ether 56:0c:a4:12:a5:3b txqueuelen 0 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 57 bytes 7476 (7.4 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

vethf098cf2: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet6 fe80::10a6:daff:fe84:d9f2 prefixlen 64 scopeid 0x20<link>
    ether 12:a6:da:84:d9:f2 txqueuelen 0 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 58 bytes 7566 (7.5 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

```

**2. ip:** It is the updated and latest edition of ifconfig command. The command provides the information of every network, such as ifconfig. Also, it can be used to get information about a particular interface.

#### Syntax:

1. ip a
2. ip addr

```
File Edit View Search Terminal Help
veth9ddb7c8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
  inet6 fe80::540c:a4ff:fe12:a53b prefixlen 64 scopeid 0x20<link>
  ether 56:0c:a4:12:a5:3b txqueuelen 0 (Ethernet)
  RX packets 0 bytes 0 (0.0 B)
  RX errors 0 dropped 0 overruns 0 frame 0
  TX packets 57 bytes 7476 (7.4 KB)
  TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

vethf098cf2: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
  inet6 fe80::10a6:daff:fe84:d9f2 prefixlen 64 scopeid 0x20<link>

root@ip-10-10-38-111:~#
```

**3.traceroute:** The traceroute command is one of the most helpful commands in the networking field. It's used to balance the network. It identifies the delay and decides the pathway to our target. Basically, it aids in the below ways:

- It determines the location of the network latency and informs it.
- It follows the path to the destination.
- It gives the names and recognizes all devices on the path.

### Syntax:

traceroute <destination>

```
root@ip-10-10-38-111:~# traceroute www.google.com
traceroute to www.google.com (209.85.202.104), 30 hops max, 60 byte packets
 1 * * *
 2 * * *
 3 * * *
 4 * * *
 5 * * *
 6 * * *
 7 * * *
 8 * * *
 9 * * *
10 * * *
11 * * *
12 * * *
13 * * *
14 * * *
15 * * *
16 * * *
17 * * *
18 * * *
19 * * *
20 * * *
21 * * *
22 * * *
23 * * *
24 * * *
25 * * *
26 * * *
27 * * *
28 * * *
29 * * *
30 * * *
root@ip-10-10-38-111:~#
```

4. **tracpath:** The tracpath command is the same as the traceroute command, and it is used to find network delays. Besides, it does not need root privileges. By default, it comes pre-installed in Ubuntu. It traces the path to the destination and recognizes all hops in it. It identifies the point at which the network is weak if our network is not strong enough.

#### Syntax:

tracpath <destination>

The screenshot shows a Kali Linux desktop environment. A terminal window is open, displaying the output of the `tracepath` command. The terminal title bar indicates the user is root at ip-10-10-38-111. The command executed is `tracepath www.google.com` with a `pmtu 1500` option. The output shows 15 hops, all of which are '[LOCALHOST]' and result in 'no reply'. The desktop background is dark blue. The taskbar at the bottom shows various application icons, including a web browser, file manager, and terminal. The system tray on the right shows the time as 11:40 AM on 8/9/2024 and the language as ENG IN.

```
root@ip-10-10-38-111:~# tracepath www.google.com
1?: [LOCALHOST] pmtu 1500
 1: 0.0000000 [LOCALHOST] pmtu 1500
 2: no reply
 3: no reply
 4: no reply
 5: no reply
 6: no reply
 7: no reply
 8: no reply
 9: no reply
10: no reply
11: no reply
12: no reply
13: no reply
14: no reply
15: no reply
```

5. **ping:** It is short for Packet Internet Groper. The ping command is one of the widely used commands for network troubleshooting. Basically, it inspects the network connectivity between two different nodes.

**Syntax:**

ping <destination>

```
root@ip-10-10-38-111: ~  
File Edit View Search Terminal Help  
[-w deadline] [-W timeout] [hop1 ...] destination  
Usage: ping -6 [-aAbBdDfhLnOqrRUvV] [-c count] [-i interval] [-I interface]  
[-l preload] [-m mark] [-M pmtudisc_option]  
[-N nodeinfo_option] [-p pattern] [-Q tclass] [-s packetsize]  
[-S sndbuf] [-t ttl] [-T timestamp_option] [-w deadline]  
[-W timeout] destination  
root@ip-10-10-38-111:~# ping 10.10.38.  
ping: 10.10.38.: Name or service not known  
root@ip-10-10-38-111:~# ping 10.10.38.111

64 bytes from 10.10.38.111: icmp_seq=29 ttl=64 time=0.032 ms  
64 bytes from 10.10.38.111: icmp_seq=30 ttl=64 time=0.031 ms  
64 bytes from 10.10.38.111: icmp_seq=31 ttl=64 time=0.047 ms  
^C  
--- 10.10.38.111 ping statistics ---  
31 packets transmitted, 31 received, 0% packet loss, time 30723ms  
rtt min/avg/max/mdev = 0.023/0.038/0.181/0.027 ms  
root@ip-10-10-38-111:~#
```

6.

**netstat:** It is short for network statistics. It gives statistical figures of many interfaces, which contain open sockets, connection information, and routing tables.

### Syntax:

Netstat

```
root@ip-10-10-38-111: ~

```

7. **ss:** This command is the substitution for the netstat command. The ss command is more informative and much faster than netstat. The ss command's faster response is possible because it fetches every information from inside the kernel userspace.

### Syntax:

Ss

```
File Edit View Search Terminal Help

```

8. **nslookup**: The nslookup command is an older edition of the dig command. Also, it is utilized for DNS related problems.

The screenshot shows a Kali Linux desktop environment with a terminal window open. The terminal title bar indicates the user is root on IP 10.10.38.111. The terminal output shows a list of network connections with columns for protocol, state, local address, remote address, and port. The connections include SYN-SENT and ESTAB states for various ports. Below the connections, the user runs the command `nslookup` to look up the IP address for `www.google.com`. The output shows the local DNS server address (127.0.0.53) and a list of non-authoritative answers for the domain, including IPv4 and IPv6 addresses.

```

>
```

## Syntax:

`nslookup <domainname>`

9. **dig:** dig is short for Domain Information Groper. The dig command is an improvised edition of the nslookup command. It is utilized in DNS lookup to reserve the DNS name server. Also, it is used to balance DNS related problems. Mainly, it is used to authorize DNS mappings, host addresses, MX records, and every other DNS record for the best DNS topography understanding.

## Syntax:

dig <domainname>

```

10. **route:** The route command shows and employs the routing table available for our system. Basically, a router is used to detect a better way to transfer the packets around a destination.

## Syntax:

Route

11. **host:** The host command shows the IP address for a hostname and the domain name for an IP address. Also, it is used to get DNS lookup for DNS related issues.

**Syntax:**

host -t <resourceName>

12. **arp:** The arp command is short for Address Resolution Protocol. This command is used to see and include content in the ARP table of the kernel.

**Syntax:**

1. Arp

13. **iwconfig:** It is a simple command which is used to see and set the system's hostname.

**Syntax:**

Hostname

14. **curl and wget:** These commands are used to download files from CLI from the internet. curl must be specified with the "O" option to get the file, while wget is directly used.

**curl Syntax:**

1. curl -O <fileLink>

15. **wget**

**Syntax:**

1. wget <fileLink>

16. **mtr:** The mtr command is a mix of the traceroute and ping commands. It regularly shows information related to the packets transferred using the ping time of all hops. Also, it is used to see network problems.

**Syntax:**

1. mtr <path>

17. **whois:** The whois command fetches every website related information. We can get every information of a website, such as an owner and the registration information.

**Syntax:**

1. mtr <websiteName>

18. **ifplugstatus:** The ifplugstatus command checks whether a cable is currently plugged into a network interface. It is not available in Ubuntu directly. We can install it with the help of the below command:

1. sudo apt-get install ifplugd

**Syntax:**

1. Ifplugstatus

**iftop:** The iftop command is utilized in traffic monitoring.

**tcpdump:** The tcpdump command is widely used in network analysis with other commands of the Linux network. It analyses the traffic passing from the network interface and shows it. When balancing the network, this type of packet access will be crucial.

**Syntax:**

1. \$ tcpdump -i <network\_device>
